wheninger, S. and Weininger, A.M.
Sequence-specific detection of nucleic acid hybrids using a
BNA-binding molecule or assembly capable of discriminating perfect
hybrids from non-perfect hybrids
Patent: US 5871902-A 26 16-FEB-1999;
Location/Qualifiers
    PAT 08-OCT-2003
                                                                                                                                         van Lint,C., Burny,A., Quivy,V. and Adam,E.
Method for obtaining the elimination of integrated and functional
viruses from infected mammal cells
Patent: WO 03053468-A 2 03-JUL-2003;

Weininger,S. and Weininger,A.M.
Sequence-specific detection of nucleic acid hybrids using a
Sequence-specific detection of specific acid hybrids molecule or assembly capable of discriminating perfect
hybrids from non-perfect hybrids
Patent: US 5871902-A 25 16-FEB-1999;

```
This sequence represents the kappa-B-PT sequence (SEQ ID 2) which contains three immunoglobulin kappa-B sequences (AAZ12918) which are contains three immunoglobulin kappa-B sequences (AAZ12918) which are bound by activated NF-kappa-B (nuclear factor kappa-B). It can inhibit NF-kappa-B inhibit NF-kappa-B binding to endogenous kappa-B enhancer/promoter elements, thus inhibiting transcription of genes that comprise such elements. NF-kappa-B confiderentiation or activation. For example, the human promyclotic leukaemia cell line (HL-60 cells) can be induced to differentiate into monocytoid cells with concomitant expression of the leukocyte adhesion of the HL-60 cells with this sequence with sportially binds NF-kappa-B. In contrast, use of a mutant kappa-B-PT sequence (AAZ12920) had no effect on differentiation and adhesion. Compositions containing the kappa-B-PT sequence may be used for the treatment of immune and inflammatory diseases, cancer and viral infections. In particular it can be used to treat heumatorid arthritis, ischaemia/intepring noise noise and HIV, crom's disease, ulcerative colitis, psoriasis, transplant rejection, Crohn's disease, ulcerative colitis, psoriasis, element of HIV, entry, respectively on inflammatory and the herpes virus infections and reaction to poison ivy, poison oak and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Composition useful for the treatment of immune and inflammatory diseases,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                        Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis;

Treating and/or preventing allergy or asthma using an immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                            Treating non-allergic inflammatory diseases, such as psoriasis, eczu allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer auth as basal cell carcinoma, bladder cancer, brain and central nervous system (CNS) cancer, breast cancer, brain and central nervous system (CNS) cancer, breast cancer, cosphageal cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, prostete cancer, rhabdomyosarcoma, skin cancer, testicular cancer, rhabdomyosarcoma, skin cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of

                                          The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.

The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urricaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the method of the invention.

```
AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding convention. The probe of the invention contains a TBR, a booster binding assembly (TBA) recognised by the probe, contains at least one binding assembly (TBA) recognised by the probe, contains at least one conclete acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95999+R95999), an asymmetry sequence (see AAR95999-R96006), a nuclear localisation signal sequence (see AAR95007), and an OSA. The assembly sequence and asymmetry sequence (see AAR95993-R96006), and an OSA. The assembly sequence and asymmetry sequence sare responsible for the folding and association of the NAR9. TATA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequence (TNA). The method is highly sensitive, and has a high contein and other nucleic acid containing systems, including bacteria and

The sequences given in AAQ58049-50 form a double stranded DNA molecule which was used as the cargo moiety in the conjugate of the invention. This oligonuclectide fragment was linked to a peptide fragment of the HIV tat protein which was used as transport moieties. These conjugates are used as cargo molecules for the efficient cytoplasmic and nuclear delivery of biologically active non-tat proteins, nucleic acids and other molecules which are not inherently capable of entering a target cell. The tat basic region amino acid sequence carries cargo molecules by covalent attachment. The reduced size of the transport peptides minimises attachment. The reduced size of the transport peptides minimises with the biological activity of the cargo molecule. By virtue of the absence of the cysteine-rich region (residues 22-36) of the tat protein, problems of genurious trans- activation and disliphide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transport of cargo moieties into cells - using genetic fusions of chemical conjugates comprising a portion of HIV tat protein as transport
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    aggrégation are solved. The reduced transport peptide size also enhances uptake efficiency. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```
This double-stranded DNA sequence, comprising oligonucleotides NF1 (sense strand) and NF2 (antisense strand), corresponds to the wild-type NF kappa B binding site. It was used in the preparation of transport polypetide. DNA conjugates. Such conjugates, in which modified HIV tat protein is used as transport polypetide, can be used to deliver cargo molecules to cells in vivo or in vitro. (Updated on 25-MAR-2003 to correct PF field.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAQS8049-50 form a double stranded DNA molecule which was used as the cargo molety in the conjugate of the invention. This oligonucleotide fragment was linked to a peptide fragment of the HIV tat protein which was used as transport moleties. These conjugates are used as cargo molecules for the efficient cytoplasmic and nuclear delivery of biologically active non-tat proteins, nucleic acids and other molecules which are not inherently capable of entering a target cell. The tat basic region amino acid sequence carries cargo molecules by covalent attachment. The reduced size of the transport peptides minimises interference with the biological activity of the cargo molecule. By virtue of the absence of the cysteine-rich region (residues 22-36) of the aggregation are solved. The reduced transport peptide size also enhances uptake efficiency. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transport of cargo moieties into cells - using genetic fusions of chemical conjugates comprising a portion of HIV tat protein as transport peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                 polypeptide moiety consisting of at least residues 49-57 of human immunosed informative interventing of at least residues 49-57 of human immunosed interventy virus (HIV) tat protein, but not residues 22-36 and 73-86, and a cargo moiety comprising a single or double stranded nucleic acid, e.g. the present sequence. The conjugate can be used to deliver cargo moieties into the cytoplasm and nuclei of cells for therapeutic, prophylactic and diagnostic applications. In an example conjugates to inhibit transcriptional activation by NF-kappaB were prepared, the corresponding to the wild type NF-KB binding site, while NF2 for a duplex corresponding to the wild type NF-KB binding site. Traut modified NF1 was annealed with NP2, and Traut modified NF3 annealed with his manaled with bismaleimidohexane activated tat 32-72. The products were tested as in Science 250, 997-1000 (1990) for inhibition of protein is readily taken up into cells and the cell nucleus. The reduced transport polypeptides minimises interference with the protein is readily taken up into cells and the cell nucleus. The reduced belongical activity of the cargo molecule. In addition, by virtue of the benefit of the transport polypeptides minimises interference with the cargo molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                     Conjugate for intracellular delivery - comprising transport moiety having amino acids 49-57 of human immunodeficiency virus tat protein and nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polypeptides solve the potential problems of spurious transactivation and disulphide aggregation. (Updated on 25-MAR-2003 to correct PF field.)

```
An onvel covalently linked chemical conjugate, comprises a transport polypeptide moiety consisting of at least residues 49-57 of human conjugated moiety desired that protein, but not residues 22-36 and 73-68, and a cargo moiety comprising a single or double stranded nucleic set the present sequence. The conjugate can be used to deliver cargo moieties into the cytoplasm and nuclei of cells for therapeutic, prophylactic and diagnostic applications. In an example conjugates to inhibit transcriptional activation by NF-kappaB were prepared, the colligonucleotides used were NF1-4 (AAFB8239-42). NF1 and NF2 for a duplex corresponding to the wild type NF-KB binding site, while NF2 and NF4 form a duplex corresponding to a muteant MF-KB binding site, while NF2 and NF4 form a duplex corresponding to a muteant MF-KB binding site. Traut modified NF1 was annealed with NF2, and Traut modified NF3 annealed with NF4. The DNA was the reacted with bismalemidohexane activated tat 32-72. The products were tested as in Science 250, 997-1000 (1990) for inhibition of products were tested as in Science 250, 997-1000 (1990) for inhibition of products were transport polypeptides minimises interference with the correction is readily taken up into cells and the cell nucleus. The reduced size of the transport polypeptides minimises interference with the absence of the cysteine rich region of the HIV tat protein, the virtue of the cargo molecule. In addition, by virtue of the call bid e agreedation of Updated on 25-MRA-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Conjugate for intracellular delivery - comprising transport moiety having amino acids 49-57 of human immunodeficiency virus tat protein and nucleic

This oligonuclectide primer is used with AAR89779 to form a duplex corresponding to the wild type transcription factor NP-kappaB binding site which is used in the construction of a transport polypeptide-DNA conjugate. This conjugate is used in a novel method for delivery of biologically active cargo molecules into the cytoplasm and nuclei of eukaryotic cells. The tat protein from immunodeficiency virus (e.g. HIV-L. SIV) is readily taken up into cells when present e.g. taracellularly and can be modified to covalently link to cargo proteins cryblems of spurious trans-activation and disulphide aggregation. These transport polypeptides also minimise interference with the biological activity of the cargo molecule. This is applicable for therapeutic, prophylactic or diagnostic intracellular delivery of small molecules and macromolecules e.g. proteins, nucleic acids and polysaccharides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This oligonucleotide primer is used with AAT89780 to form a duplex corresponding to the wild type transcription factor NP-kappaB binding site which is used in the construction of a transport polypeptide-DNA conjugate. This conjugate is used in a novel method for delivery of biologically active cargo molecules into the cytoplasm and nuclei of eukarypotic cells. The tat protein from immunodeficiency virus (e.g. HIV-1, HIV-2, SIV) is readily taken up into cells when present extracellularly and can be modified to covalently link to cargo proteins cransport polypeptides also minimise interference with the biological cransport polypeptides also minimise interference with the biological activity of the cargo molecule. This is applicable for therapeutic, prophylactic or diagnostic intracellular delivery of small molecules and macromolecules e.g. proteins, nucleic acids and polysaccharides. This sequence is a phosphorothioate primer used in a method for the delivery of biologically active cargo molecules into the cytoplasm and mucle of cells, for therapeutic, prophylactic or diagnostic purposes.

This is accomplished by the presence of a small, basic section of the tat transport protein from human immunodeficiency virus (HIV) Type I. This is cused as it is this protein which is observed to cause human cells in culture to take up HIV. The method involves the use of a cargo moiety in combination with a transport moiety usually in the form of a fusion combination with a transport moiety usually in the form of a fusion cretains its biological activity after delivery into a target cell and where the transport moiety is one of following HIV tat protein fragments (a) as 47-58, (b) as 47-72, (c) 38-72, (d) as 38-58, (e) as 37-58, (f) as 37-58, (e) as 37-58, (e) as 38-52. The proteins allow delivery of specific peptides into cells at high concentrations due to use of existing transporters. Previous methods of delivery include bombardment and transforming, which only allow a fraction of the cell population to be infected and can additionally damage cells as they cause physical combination contents of the cell population to be infected and can additionally damage cells as they cause physical contents and transforming of the cell walls/membranes to allow entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              <u>Б</u>,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is a phosphorothioate primer used in a method for the delivery of biologically active cargo molecules into the cytoplasm and nuclei of cells, for therapeutic, prophylactic or diagnostic purposes. This is accomplished by the presence of a small, basic section of the tat transport protein from human immunodeficiency virus (HIV) Type I. This is used as it is this protein which is observed to cause human cells in culture to take up HIV. The method involves the use of a cargo moiety in combination with a transport moiety usually in the form of a fusion or protein. The cargo moiety is a human papillomavirus B2 repressor that retains its biological activity after delivery into a target cell and where the transport moiety is one of following HIV tat protein fragments of a a 47-58, (b) aa 47-72, (c) 38-72, (d) aa 38-58, (e) aa 37-58, (f) aa 57-58, (c) 38-72, (d) aa 38-58, (e) aa 37-58, (f) acception proteins allow delivery of specific peptides into cells at high concentrations due to use of existing transporters. Previous methods of delivery include bombardment conditionally damage cells as they cause physical cell walls/membranes to allow entry. (Updated on 25-MAR-

            The invention relates to a method for delivering a biologically active cargo molecule of interest into a cell. The method comprises presenting to the cell an extracellular fusion protein or a covalently linked conjugate consisting of a cargo moiety and a transport moiety having amino acids 49-57 of human immunodeficiency virus (HIV) transactivator (tat) protein and lacking amino acids 22-36 and 73-86 of HIV tat protein. The method is useful for delivering a molecule of interest such as polypeptides, antigen, monoclonal antibody, single- or double-stranded conclet acid, a therapeutic, prophylactic and diagnostic molecule to a cell in vitro or in vivo. The method delivers proteins or peptides, including regulatory factors, enzymes, drugs or toxins into the cytoplasm and cell nucleus. The method is useful for diagnostic, prophylactic or therapeutic intracellular delivery of small and macro molecules. The present sequence is a phosphorothiate oligonucleotide used for generating nuclear factor kappa B (NFRB) wild type binding site used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                         Delivering biologically active cargo molecules such as polypeptides, nucleic acids into cells by using transport polypeptides which comprise human immunodeficiency virus transactivator protein linked to cargo

The invention relates to a method for delivering a biologically active cargo molecule of interest into a cell. The method comprises presenting to the cell an extracellular fusion protein or a covalently linked conjugate consisting of a cargo molety and a transport molety having amino acids 49-57 of human immunodeficiency virus (HIV) transactivator (tat) protein and lacking amino acids 22-36 and 73-86 of HIV tat protein. The method is useful for delivering a molecule of interest such as polypeptides, antigen, monoclonal antibody, single- or double-stranded cucleic acid, a therapeutic, prophylactic and diagnostic molecule to a cell in vitro or in vivo. The method delivers proteins or peptides, including regulatory factors, enzymes, drugs or toxins into the cytoplasm and cell nucleus. The method is useful for diagnostic, prophylactic or therapeutic intracellular delivery of small and macro molecules. The therapeutic intracellular delivery of small and macro molecules. The present sequence is a phosphorothiate oligonucleotide used for generating nuclear factor kappa B (NFRB) wild type binding site used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The composition is used for the treatment of cancer, inhibiting the initiation and promotion of mammalian epithelial cells (such as skin, colon, uterine, ovarian, pancreatic, prostate, renal, lung, bladder or breast cells), for preventing the abnormal profileration of mammalian epithelial cells (such as crypt or colon cells), and/or regulating angiogenesis. The triterpene glycosides may also be used as solvent, an antioxidant, antifungal or antiviral agent, piscicide, molluscicides, contraceptive, antihelmintic, angiogenesis regulator, UV-protectant, expectorant, diuretic, anti-inflammatory agent, regulator of cholesterol metabolism, cardiovascular effecter, anti-ulcer agent, analgesic, sedative, immunomodulator, combating the effects of aging, increasing skin collagen, enhancing penile function and improving cognition and memory. The present sequence represents an integral and int
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mixture containing triterpene glycosides, useful for treating variety of

This sequence represents a novel method for inhibiting inflammation which comprises administering a monoterpene composition that inhibits NFKappaB. The products of the invention have antiinflammatory,
                                                                                           antiparkingolerotic, antirhemmatic, antiarthrilic, osteopathic, antiparkingonian, nootropic, neuroprotective and antiparkingonian activity. The method described can be used for treating inflammatory diseases, particularly premalignant inflammatory disease (e.g. Barretts esophagitis, inflammatory bowel disease, chronic pancreatitis, chronic prostatitis, familial polyposis and actinic keratosis), artherosclerosis, rheumatoid arthritis, osteoarthritis, multiple sclerosis, Parkinson's disease and Alzheimer's disease. This sequence represents a 32P-labelled NFkappaB Oligonicleotide used in an electrophoretic mobility shift assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Target binding assembly, nucleic acid recognition unit; NF-kappa-B; SPl; ATAR; human papillomavirus; HPV; HPV E2; human immunodeficiency virus; HIV LTR; Tat binding unit; probe; assembly sequence; asymmetry sequence; nuclear localisation signal sequence; human cell; HPV LTR; HIV; bacteria;

19-FEB-1997 (first entry)

Farget binding region #23.

```
AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR) and optionally a linker sequence, an assembly sequence (see AAR$95994-R$998), an asymmetry sequence (see AAR$95994-R$989), an asymmetry sequence (see AAR$95994-R$9893) are association of the NARs. The NARS (see AAR$96007), and an OSA. The assembly sequence and asymmetry sequence (see Cor the folding and association of the NARs. The NARS (see AAR$96007).

Cor the folding and association of the NARs. The NARS (see AAR$96007).

Cor the folding and association of the NARs. The NARS (see AAR$96007).

Cor the Linker sequence is an oligopetide, which does not interfere with NAR function, but provides stability and control over the spacing of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequences, including those found in human calls, in HIV, HIV, and other nucleic acid containing systems, including bacteria and

ANTIOSBI-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding cregion (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AARS95994-R95998), an asymmetry sequence (see AARS9599-R96006), a nuclear localisation signal sequence (see AARS96007), and an OSA. The assembly sequence and asymmetry sequence (see AARS9599-R96006), an association of the NARS. The NARS (see AARS96007), and an OSA. The association of the NARS. The NARS (see AARS9605-CR95993) are selected from NF-Kappa B, SPI, TATA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding cuits. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indiactor, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation a specific target nucleic acid sequence (TNA). The method is highly sensitive, and has a high edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity. The method can be used for detecting and edgree of specificity in HIV, and other nucleic acid containing systems, including bacteria and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó;

The invention relates to a method for inhibiting the proliferation of, and inducing apoptosis in multiple myeloma cells comprising and inducing apoptosis in multiple myeloma cells comprising cadministration of curcumin (diferuloylmethane). The invention also relates to a method for increasing the cytotoxic effects of a chemotherapeutic agent (e.g., vincristine, bichloroethylnitrosourea, chemotherapeutic agent (e.g., vincristine, prediisone or dexamethasone) against multiple myeloma cells (preferably CD138+ plasma cells) comprises administration of the chemotherapeutic agent against increases the cytotoxic effects of the chemotherapeutic agent against increases the cytotoxic effects of the chemotherapeutic agent against cultiple myeloma cells. It suppresses constitutive I-kappa-B-alpha phosphorylation through inhibition of I-kappa-B kinase activity, and compression of proliferation and arrest of cells at the GI/S phase of the call cycle. The methods of the invention are used for the treatment of multiple myeloma. The present sequence represents an NF-kappa-B binding call cycle. The methods of the invention are used for the treatment of multiple myeloma. The present sequence represents an NF-kappa-B binding call an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 osteopathic; osteogenesis; nuclear factor kappa B; cancer; breast tumor; myeloma; osteoporosis; Paget's disease; rheumatoid arthritis; head and neck tumor; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMSA probe for detecting NF-kappaB activation in curcumin treated cells.
                                                                                                                                                                                                                                            Inhibiting proliferation of multiple myeloma cells comprises administering curcumin and optionally with vincristine, bichloroethylnitrosourea, melphalan, cyclophosphamide, adriamycin, predmisone or dexamethasone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a HIV-LTR oligonuclectide used to test the method of the invention. The method is for inhibition of activation of the NF-kappaB transcription factor (A), for treatment of toxic or septic shock or graft versus host reactions in humans, comprises administration of curcumin (I, diferuloylmethane). (I) is used to treat toxic or septic shock and graft versus host reactions in humans. (I) may be used to inhibit activation of (A) e.g. in cases of radiation damage, atherosclerosis, cancer and human immune deficiency virus (HIV) infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                            The invention relates to a method of reducing or inhibiting osteoclast development induced by the receptor for activation of nuclear factor Kappa B ligand (RANKL) by contacting the osteoclast or its precursor with acetoxychavicol or their analogues. (I) is useful for reducing or inhibiting osteoclast development induced by RANKL, inhibiting the formation of osteoclasts in an individual and reducing osteoclasts in an individual and reducing osteolytic activity and bone loss in an individual having breast cancer, multiple myeloma, post-menopausal osteoporosis, Paget's disease, rheumatoid arthritis or head and neck squamous cell carcinoma. The diferuloylmethane (curcumin) is safe to humans. This sequence corresponds to an electromobility shift assay (EMSA) probe used to analyze NF-kappaB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligo from HIV long terminal repeat containing NF-kappaB binding site.
                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nuclear factor-kappa B; NF-kappaB; NF-kappaB inhibitor; apoptosis stimulation; cancer; cytostatic; HIV long terminal repeat;
                                              Use of compounds comprising diferuloylmethane, guggulsterone, 1'-acecoxychavicol or their analogues to e.g. reduce/inhibit osteoclast development induced by the receptor for activation of nuclear factor kappa B ligand.
                                                                                                                                                                                                                                                                   activation in curcumin-treated or untreated cells. The sequence is derived from the human immunoeficiency virus 1 long terminal repeat.
                                                                                                                                                                                                                                                                                                                                               ö

And The present invention relates to cell permeable nuclear factor (NF)-
kappaB, and specifically to polypeptides that selectively inhibit NF-
kappaB, and specifically to polypeptides that selectively inhibit NF-
cappaB, and specifically NF-kappaB mediated gene expression and
chibitor comprises (i) a peptide fragment of the p65 submit of NF-
cappaB, where the peptide comprises phosphorylation site(8) of the p65
submit and (ii) a protein transduction domain which is able to transport
the polypeptide across cell membrane. The protein transduction domain is
cerived from a protein of domain selected from third helix of the
antennapedia homeodomain (SEQ ID NO:3), herpes virus structural protein,
or HIV tat protein. Also disclosed is an isolated DNA encoding the
inhibitor. Provided is a method of inhibiting the DNA binding activity of
NF-kappaB; a method of increasing the level of apoptosis; and a method of
treating cancer. Inhibiting the DNA binding activity of NF-kappaB in a
cell comprises contecting a cell with the inhibitor above, where the
inhibitor suppresses NF-kappaB binding to DNA. Activity is induced by an
agent, e.g. TNF, LPS, IL-1, okadaic acid, phorbol myristate acetate
ceptor-associated death domain (TRADD), TNF receptor-associated factor-
ceptor-associated death domain (TRADD), TNF receptor-associated factor
ceptor-associated death domain (TRADD), TNF receptor-associated factor
ceptor-associated death domain (TRADD), TNF receptor-associated from the
central complex to examine the specificity of binding of NF-kappaB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Target binding assembly, nucleic acid recognition unit; NF-kappa-B; SP1; ATAR, human papillomavirus, HPV; HPV E2; human immunodeficiency virus; HIV LTR; Tat binding unit; probe; assembly sequence; asymmetry sequence; nuclear localisation signal sequence; human cell; HPV LTR; HIV; bacteria;
                                                                                    New cell permeable nuclear factor kappaB inhibitor comprising a peptide fragment and a protein transduction domain, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

Probe nucleic acids, target binding assemblies, etc - for detection and

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding convention. The probe of the invention contains a TBR, a booster binding assembly (TBA) recognised by the probe, contains at least one binding assembly (TBA) recognised by the probe, contains at least one concleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95094-R95999), an asymmetry sequence (see AAR95097), and an OSA. The assembly sequence and asymmetry sequence (see AR95097), and an OSA. The assembly sequence and asymmetry sequence (see AAR95093) are selected from NF-Kappa-B, SPI, TATP, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding contints. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation as pecific target nucleic acid sequence (TNA). The method is highly sensitive, and has a high conteic acid sequences, including those found in human calls, in HIV, HPV, and other nucleic acid containing systems, including bacteria and localisation of specific nucleic acid sequences, esp. HIV and HPV. Disclosure, Page 71; 172pp; English.

Probe nucleic acids, target binding assemblies, etc - for detection and localisation of specific nucleic acid sequences, esp. HIV and HPV.

Disclosure; Page 70; 172pp; English.

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR) and optionally a linker sequence, an assembly sequence (see AAR5994-R5999), an asymmetry sequence (see AAR5999-R96006), an unclear localisation signal sequence (see AAR9509).

AAR9599-R96006), a nuclear localisation signal sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence (see AAR95993) are selected from NF-kappa-B, SPI, TATA, human papillomavirus (HFV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indiactor, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequences (TNA). The method is highly sensitive, and has a high edgree of specificity. The method can be used for detecting and edgree of sequences, including those found in human calls, in HIV, HIV, and other nucleic acid containing systems, including bacteria and viruses

Ikaros poly:peptide(s) - useful for treating disorders of immune system or corpus striatum

Disclosure; Col 27; 111pp; English.

The present invention describes a purified peptide having at least one of the following properties: (a) it stimulates transcription of a DNA sequence under the control of a delta A element, an NFKB element or an Ikaros binding oligonucleotide consensus sequence; (b) it binds to any of

a delta A element, an NFKB element or an Ikaros binding oligonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring Ikaros isoform to amy of a delta A element, an NFKB element or an Ikaros binding oligonucleotide consensus sequence; (d) it competitively inhibits Ikaros binding to Ikaros responsive elements; or (e) it inhibite protein-protein interactions of transcriptional complexes formed with naturally occurring ikaros isoforms. The proteins, provided that they stimulate gene transcription under the control of delta A elements, NFKB elements and/or Ikaros-binding oligonucleotides, competitively inhibit binding of naturally occurring Ikaros isoforms to delta A elements, NFKB elements and/or Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros-responsive elements and/or intubit protein-protein interactions of transcriptional complexes with alternating control of the present invention or ADDS, or corpus striatum disorders, e.g. leukaemia or ADDS, or corpus striatum disorders, e.g. given in the present invention

I-cell pathway regulatory gene, Ikaros - encodes family of unique zinc finger proteins, useful for treating immune system disorders. Disclosure; Page 29; 112pp; English.

The Ikaros gene encodes a zinc finger protein which can be used in a therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is at risk for an immune disorder. It is of particular use in treating a disorder of the corpus striatum. Heterologous genes may be expressed by placing them under the control of an Ikaros responsive control element and contacting the element with an Ikaros protein. Potential high affinity binding sites

AAT30615-T30634 represent probe nucleic acids of the invention. The probe of the invention contains a target binding region (TBR), a booster binding region (BRR), and an optional support or attendment (GSA). The target binding assembly (TBA) recognised by the TBR (see AAT30581-T30614) of the probe, contains at least one nucleic acid recognition unit (NAR), or optionally a linker sequence, an assembly sequence (see AAR9599-R96006), a nuclear reguence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequences are responsible for the folding and sequence and asymmetry sequences are responsible for the folding and sequence and asymmetry sequences are responsible for the folding and immunodeficiency virus (HIV) LTR and Tat binding units. The linker immunodeficiency virus (HIV) LTR and Tat binding units. The linker count of the NAR function, but provides stability and control over the spacing of the NAR function, but provides stability and control over the spacing of the NAR function, cost the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for ö for the Ikaros proteins were found in the enhancer and promoter regions of the TCR-alpha, -beta and -delta, the CD3-delta, -epsilon and -gamma genes, the SL3 and HIV long terminal repeat and in the regulatory domains of other T cell restricted antigens. Related sequences to the Ikaros motif were also found in the purine boxes of the IL2 gene in the in the HIV long terminal repeat. See also AAQ61504-Q61543.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This oligonuclectide from the HIV long terminal repeat was identified as a potential high affinity binding site for Ikaros (see AAW70963-71). It partially includes a core motif GGGAA found in consensus recognition sites of murine Ikaros isoforms MR+1, mR+2 and mR+3, Gsee AAV52830-32). High affinity binding sites for Ikaros have been found in enhancer and promoter regions of the regulatory domains of the TCR antigen complex, the CD3 genes, the SL3 and HIV long terminal repeat and in the regulatory domains of other T cell restricted antigens (see AAV4538-402) by gel retardation assay, Ikaros is involved in early differentiation of lymphocytes. The invention provides Ikaros nucleic acids (see AAV42805-11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and AAV42840) and polypeptides, vectors and host cells. These are used to treat T and B cell diseases, to control expression of heterologous genes placed under control of an Imaros-responsive element, to treat nervous system diseases and to modulate cell division, amplification or

The invention relates to an animal with a structurally intact Tp12 gene but functionally disrupted endogenous Tp12 (a protooncogene which encodes a cytoplasmic serime threoning kinase). The animal has increased resistance to lipopolysaccharide-induced endotcoxin shock or tumour resistance to lipopolysaccharide-induced endotcoxin shock or tumour and DNA are useful for identifying compounds that agonise or inhibit the function of Tp12 protein. Tp12 is useful for treating rheumatoid arthritis. Th7alpha-mediated inflammatory diseases or inhibit the function of Tp12 protein. Tp12 is useful for treating she marrow derived cells arthritis. Th7alpha-mediated by transfecting bone marrow derived cells invitro with a DNA construct which encodes sequences that interferes with the expression of function of the endogenous Tp12 in the cells and administering the cells to an animal. The knock out animals and the constructs used to generate the animals are useful in the development of compositions and methods of treating inflammation. Tp12 agonist and constructs useful in taraction of the mechanistic action of the novel cantagonist are useful as targets for the development of novel the alutidation of the mechanistic action of the novel cantagonist and protein interactions involved in inflammatory disorders. Tp12 endotoxin shock and/or antiinflammatory component sequence and protein interactions involved in inflammatory disorders. Tp12 endotoxin shock and/or antiinflammatory component sequence and protein interactions involved in Inflammatory disorders. Tp12 endotoxin shock and/or antiinflammatory component sequence and protein interactions involved in the present sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an animal with a structurally intact Tp12 gene but functionally disrupted endogenous Tp12 (a protooncogene which encodes a cytoplasmic serine threomine protein kinase). The animal has increased resistance to lipopolysaccharide-induced endotoxin shock or tumour and DNA are useful for identifying compounds that agoinse or inhibit the cumour of Tp12 is useful for treating rheumatoid arthritis. TNFalpha-mediated inflammatory diseases. Tp12 protein arthritis. TNFalpha-mediated inflammatory diseases or LPS induced arthritis. TNFalpha-mediated inflammatory diseases or LPS induced conductorin shock, may be treated by transfecting bone marrow derived cells invitro with a DNA construct which encodes sequences that interferes with the expression of function of the endogenous Tp12 in the cells and constructs used to generate the animals are useful in the development of compositions and methods of treating inflammation. Tp12 agonist and an encodensist are useful as targets for the development of novel therapeutic antagonist are useful in the development of antagonist are useful as targets for the development of novel therapeutic agents which eliminate the functional role of Tp12 and as research tools to facilitate the elucidation of the mechanistic action of the novel

                                                                                                                                                                        The present invention provides assays for identifying compounds which modulate NF-kappaB. NF-kappaB, along with IgNF-A, IgNF-B and IgNF-B, i lymphoid cell nuclear factor which regulates the transcription of the immunoglobulin genes. The modulators are useful in the control of activation of host cells
                                                                            DNA
                                                                         Identifying an NF-kappa B modulator, useful for analyzing protein DNA interactions in cells or in identifying transcriptional regulatory factors by detecting NF-kappa B or IKB DNA binding activity level or cytoplasmic localization.
                                                                                                                                                                                                                                                                                                                               Gaps

The present seguence is that of a primer corresponding to nucleotides 344 Use of deacetylase inhibitor combined with one or more compounds used in viral treatment, for manufacturing medicament for obtaining elimination of integrated, functional and pathogenic virus e.g. HIV-1 in mammal cell. Adam E; Disclosure; Page 10; 56pp; English Quivy V, Burny A, WPI; 2003-569183/53. Van Lint C,

shock protein, useful in the treatment of transplant rejection, autoimmune diseases and cancer. The present sequence is a primer which was used to determine the concentration of a fusion protein in an electrophoretic mobility shift assay. The fusion protein comprised the Cterminuus of the 70kD heat shock protein (HBP70), and the p50 subunit of transcription factor NF-kappaB. The fusion protein was created in order to determine the ability of the HBP70 sequence to direct other proteins into the cell, a feature which can be used in the treatment of transplant rejection, autoimmune diseases guch as rheumatoid arthritis, multiple sclerosis, diabetes, asthma, inflammatory bowel disease, psoriasis, hepatitis, Graves disease and viteligo, inflammatory distress including osteoarthritis, pancreatitis and adult respiratory distress syndrome, cancer, vascular diseases (such as restenosis and atherosclerosis) and DNA and RNA viral replication diseases (including herpes) Sequence 35 BP; 5 A; 9 C; 13 G; 8 T; 0 U; 0 Other; Example 6; Page 21; 37pp; English. Fujihara SM, Nadler SG; WPI; 2000-400029/34 Best Loca Matches RESULT 44 셤 ò The invention describes an isolated nuclear protein NF-kappaB (I) which binds: in a sequence specific manner, to a transcriptional regulatory DNA clement of an immunoglobulin light or heavy chain genes, or both; in a sequence specific manner, to enhancer DNA sequences of the kappa light chain gene; or to DNA sequences in the upstream region of both mouse cheavy and kappa light chain gene promoters, and to DNA sequences of mouse cheavy chain gene enhancer. (I) is useful for enhancing the transcription of the gene of interest, and for screening for expression of sequence specific binding protein. A polyclonal or monoclonal antibody (II) specific binding protein. A polyclonal or monoclonal antibody (II) specific manner, to a transcriptional regulatory DNA element of an immunoglobulin light or heavy chain gene, or both is useful in an immunoglobulin light or heavy chain gene, or both is useful in an immunoglobulin light or heavy chain gene, or both is useful in a biological fluid, where (II) is specifically reacts with lower be not a transcription of the section of a transcription of the sequence comprising (III) linked to DNA encoding an activator of the RNA comprising (III) linked to DNA encoding the construct into the cell. Novel isolated nuclear protein NF-kappaB that binds in sequence specific manner to transcriptional regulatory DNA element of immunoglobulin light or heavy chain genes, or both, useful for enhancing transcription of gene Sharp PA, Singh H, Staudt L, Lebowitz JH; , Corcoran LM, Baeuerle PA, Lenardo MJ, Fan C;

```
to 377 of the coding strand sequence of the HIV-1 LAI 5' long terminal repeat (LTR), and including an added KpnI restriction site. This was used as 5' primer, with the 3' primer given in ACF05496, to amplify a 186 bp fragment of the 5' LTR (nuclectides 345-531) for use in the plasmid construct pLTR(345-531)-luc. This plasmid was used to demonstrate the trichostatin-A (TSA) inducibility of HIV-1 LTRs and also to show that inteat kappaB sites are required for maximal TSA inducibility of the HIV-1 LTRs and also to show that inteat kappaB sites are required for maximal TSA inducibility of the HIV-1 LTRS and also to show that concer. The invention relates to the use of a deacetylase inhibitor and the manufacture of a medicament for obtaining elimination of integrated, functional and pathogenic viruses, e.g. HIV-1, in a mammal cell, including a human cell. This allows significant elimination and possible suppression of the presence of virus in a patient and therefore improves long-term control of viral infections in patient and therefore highly active antiretroviral therapy (HAART) treatment

Probe nucleic acids, target binding assemblies, etc - for detection and localisation of specific nucleic acid sequences, esp. HIV and HPV.

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least on nucleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95994-R95998), an asymmetry sequence (see AAR95994-R95998), an asymmetry sequence (see AAR96007), and an OSA. The assembly sequence and asymmetry sequence ser responsible for the folding and association of the NARS. The NARS (see AAR95965-

```
R95993) are selected from NF-kappa-B, SP1, TATA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequence (TNA). The method is highly sensitive, and has a high andleic acid sequences, including those found in human cells, in HIV, HPV, and other nucleic acid containing systems, including bacteria and

Treating uro-genital conditions, such as vaginitis, cystitis, urethritis, or balanoposthitis comprises using alpha-melanocyte stimulating hormone or a derivative of it.

Example 9; Page 15; 37pp; English.

The present sequence is an oligonucleotide used to determine the level of NF-kB activity in human UI cells treated with alpha-melanocyte stimulating hormone (alpha-MSH). Alpha-MSH and its derivatives were shown to inhibit TNF-alpha induced NF-kB activation and binding. Alpha-MSH and its derivatives have potent antipyretic and antinflammatory properties, yet they have extremely low toxicity. A uro-genital condition treatment system has been developed that comprises a carrier and a polypeptide including a sequence derived from alpha-MSH. The system may be used to treat a uro-genital condition such as vaginitis, cystitis, urethritis, or balanoposthitis. It may also be used to prevent toxic shock syndrome and infection from sexually transmitted diseases, and to treat an antibiotic resistant microorganism. The polypeptides used in the treatment system

The alpha-MSH is useful for combating cancer and for inhibiting cancer cell proliferation, where the cancer is mesothelioma, and is selected from Hodgkin lymphoma, non-Hodgkin lymphoma, squamous cell carcinoma, breast cancer and colorectal cancer. Sequences ACC47365-366 represent positive and negative strands of NF-kappaB DNA binding site, used in DNA binding assays for determining alpha-MSH inhibition of NF-kappaB in cancer cells

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95994-R85998), an asymmetry sequence (see AAR95994-R85998), an asymmetry sequence (see AAR95007), and an OSA. The assembly sequence and asymmetry sequence see AAR96007), and an OSA. The assembly sequence and asymmetry sequence see AAR95007), and an OSA. The assembly sequence in an asymmetry sequence (see AAR95965-CC for the folding and association of the NARs. The NARs (see AAR95965-CC in the Innker sequence is an Oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation of the probe. The probe can be degree of sepecificity. The method is highly sensitive, and has a high degree of specificity. The method can be used for detecting specific nucleic acid sequences, including those found in human cells, in HIV, HIV, and other nucleic acid containing systems, including bacteria and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

invention. The probe of the invention contains a TBR, a booster binding invention. The probe of the invention contains a TBR, a booster binding invention. The probe of the invention contains a TBR, a booster binding assembly, and an optional support or attachment (OSA). The target binding assembly (TBA) recognition unit (NAR), and optionally a linker sequence, an assembly sequence (see AAR95994-R95998), an asymmetry sequence (see AAR95066), a nuclear localisation signal sequence (see AAR95067), and an OSA. The assembly sequence and asymmetry sequence see AR86007), and an OSA. The assembly sequence and asymmetry sequence see AR895965. Cfor the folding and association of the NARS. The NARS (see AAR95965-CC For the folding and association of the NARS. The NARS (see AAR95965-CC For HV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an olisopopebide, which does not interfere with NAR from the rest of the TBA. The GSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation of the probe. The probe can be caid sequence (TNA). The method can be used for detecting specific cucles and sequences, including those found in human cells, in HIV, and other nucleic acid sequences, including those found in human cells, in HIV, and other nucleic acid sequences, including systems, including bacteria and
```

The present sequence is an oligonucleotide used to determine the level of NF-KB activity in human UI cells treated with alpha-melanocyte trimulating hormone (alpha-MSH). Alpha-MSH and its derivatives were shown to inhibit TMF-alpha induced NF-KB activation and binding. Alpha-MSH and its derivatives have potent antipyretic and antiinflammatory properties; yet they have extremely low toxicity. A uro-genital condition treatment system has been developed that comprises a carrier and a polypeptide including a sequence derived from alpha-MSH. The system may be used to treat a uro-genital condition such as vaginitis, cystitis, urethritis, or balanoposthitis. It may also be used to prevent toxic shock syndrome and infection from sexually transmitted diseases, and to treat an antibiotic resistant microorganism. The polypeptides used in the treatment system can reduce the viability of microbes, treat inflammation associated with microbial infection, increase the accumulation of cAMP in microbes and inhibit replication and

Treating uro-genital conditions, such as vaginitis, cystitis, urethritis, or balanoposthitis comprises using alpha-melanocyte stimulating hormone or a derivative of it.

MOLECULE TYPE: Other nucleic acid;
DESCRIPTION: SYNTHETIC DNA
                                                                                                                                                                                         MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPATITE SYSTEM: PC-DOS/MS-DOS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LENGTH: 38 base pairs
                                                                                                                                       ZIP: 22202
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TYPE: nucleic acid
STRANDEDNESS: both

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 2, Application US/08607519
Patent No. 5990090
GENERAL INFORMATION:
APPLICANT: NAME OF INVENTION: METHODS AND COMPOSITIONS FOR TREATMENT
TITLE OF INVENTION: OF DISEASES
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
ADDRESSEE: OBLON, SPIVAK, MCCLELLAND, MAIER & NEUSTADT,

Patent No. 5871902
GENERAL INFORMATION:
PAPLICANT: Weininger, Susan
APPLICANT: Weininger, Arthur M
TITLE OF INVENTION: METHOD OF DETECTION OF DNA WITH A
TITLE OF INVENTION: SPECIFIC SEQUENCE COMPOSITION
NUMBER OF SEQUENCES: 117
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDIUM TYPE: Floppy disk
